

TREE PRUNING SERVICES

Our goal is simple – a long and healthy life for the trees planted in our community.

Minor structural pruning within the first 10 years after planting can make a big difference and reduce future pruning costs and damage.

Although we are willing to help with any tree, our target objective is pruning trees that have been recently planted (2-10 years) and are less than 30 ft tall.

- Establishing a strong central leader.
- Removing or reducing codominant competing leaders.
- Removing temporary branches that have been left until the tree becomes established (providing clearance).
- Removing acute angle and crossing branches, leaving a good permanent scaffold.
- Influencing flower/fruit production.
